

WMM7040DBB1P0

Bottom port digital silicon Microphone

Descriptions

WMM7040DBB1P0 is a Silicon Microphone with digital output and bottom inlet for sound input. It consists of a MEMS sensor and an encoder IC. It converts sensor analog output signal into 1-bit digital PDM data. The digital output format eliminates AC coupling capacitor, reduces RF noise coupling and eases PCB layout requirement.

WMM7040DBB1P0 is a cost-effective alternative to traditional electret condenser microphone (ECM). Provided on tap-and-reel, it is ideally suited for high volume applications. And it can be processed directly to customer's PCB using standard automatic pick-and-place equipment and surface mounted via standard solder reflow equipment.

WMM7040DBB1P0 can be used to implement the array microphones. Speech quality can be significantly improved by combining two microphones.

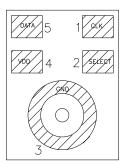

The WMM7040DBB1P0 is manufactured in a compact 4.00mm*3.00mm*1.20mm, 5-pin package.
